

Sonoma County Water Agency Stream Maintenance Program

Informing Vegetation Management

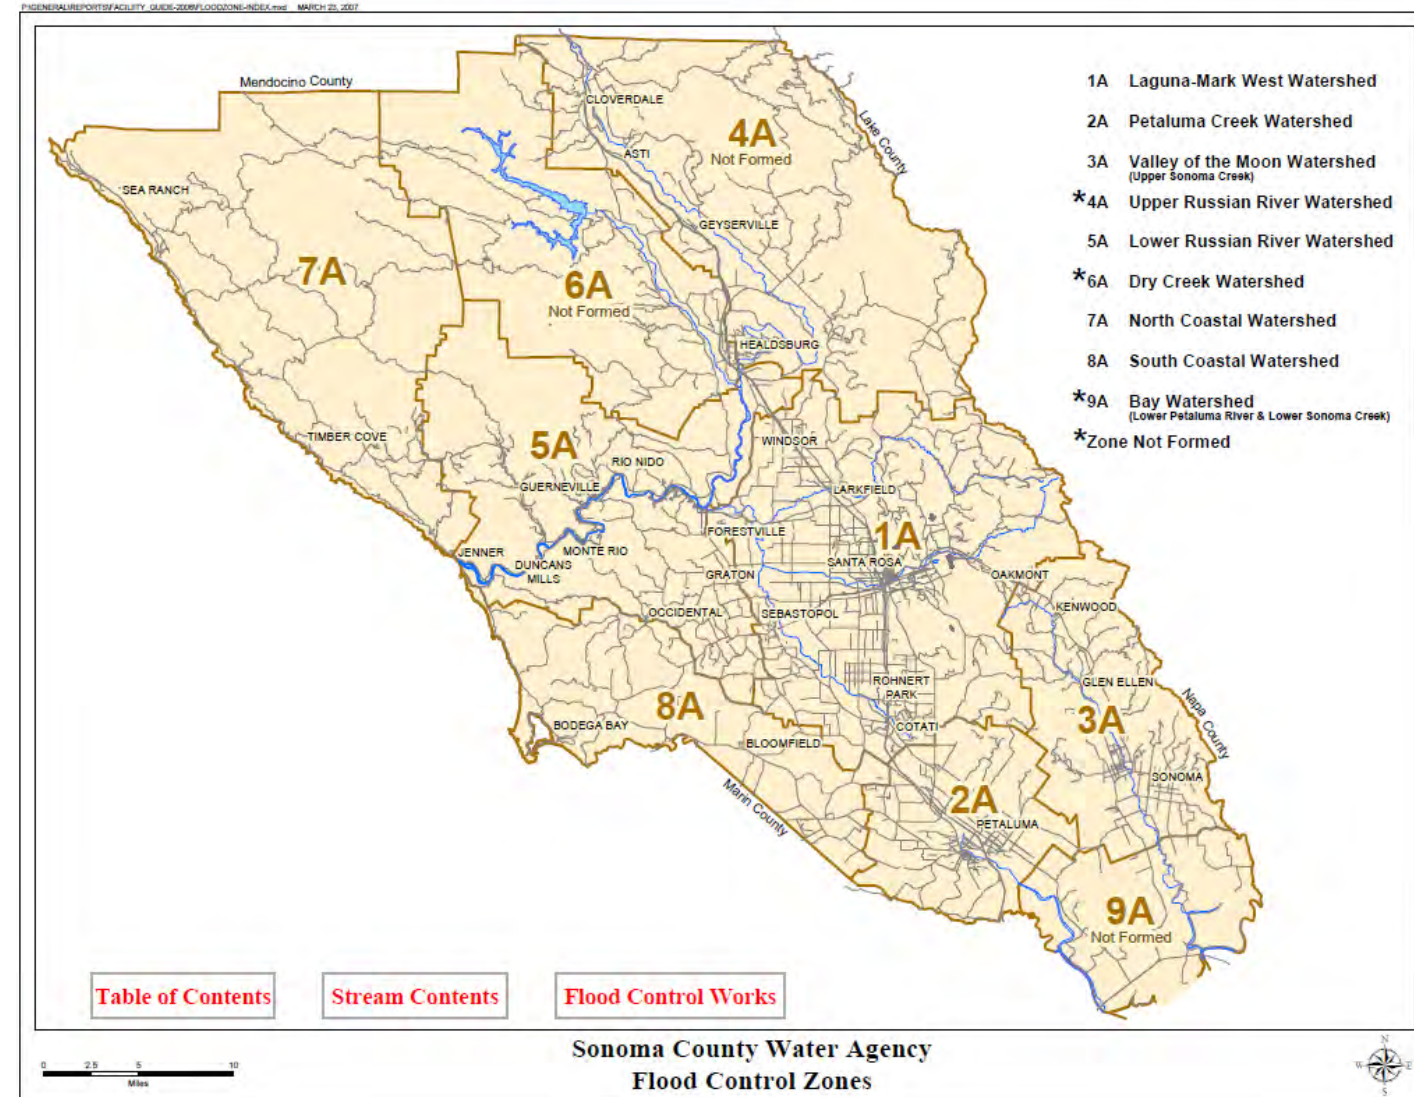

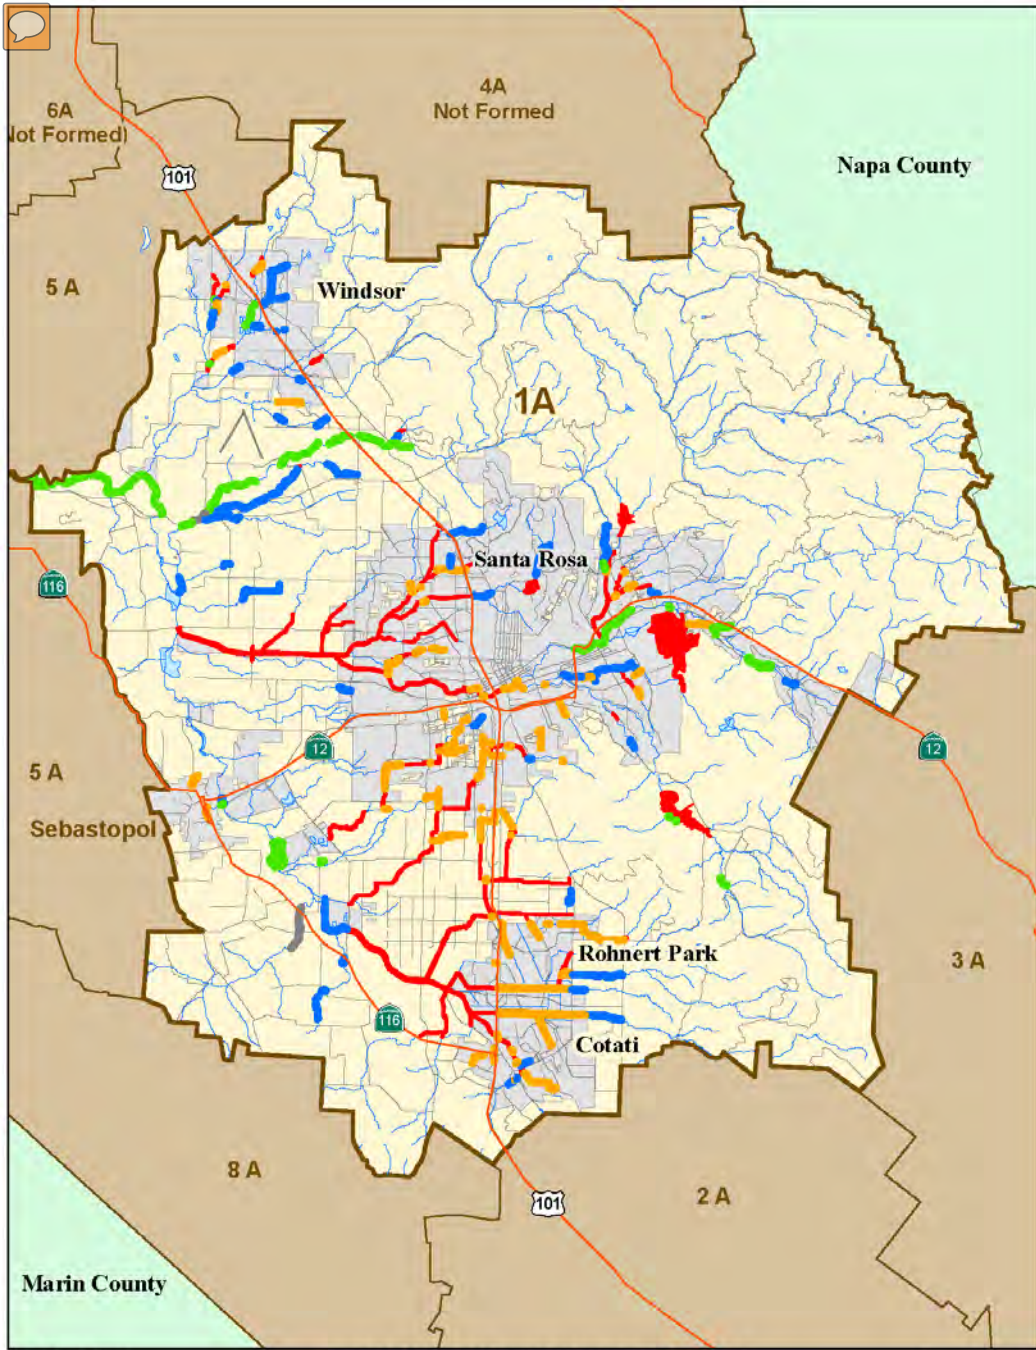

May 18, AEP San Francisco Bay Area

Sonoma County Water Agency Stream Maintenance Program

- 75 miles of engineered flood control channels
- 150 miles of natural channel easements
- Central Sonoma Watershed Project
 - Channels
 - Reservoirs

Brush Creek

Historic Vegetation Management

Facility Constraints

- Depositional channels
- Crossings and culverts often control hydrology
- Largely urban land use
- Work occurs only in easements
- Ponded and perched systems
- Linear trails/parks, access and pedestrian safety
- Require regular mowing for fuel reduction (fire)
- Homeless encampments

Multiple Goals of Vegetation Management

- Preserve flood protection capacity
- Improve habitat and water quality conditions
- Maintain public safety
- Reduce frequency of required maintenance
- Monitor stream conditions & maintenance needs
- Develop watershed partnerships

Inherent Principles of Vegetation Management

- Species selection and location are key for success

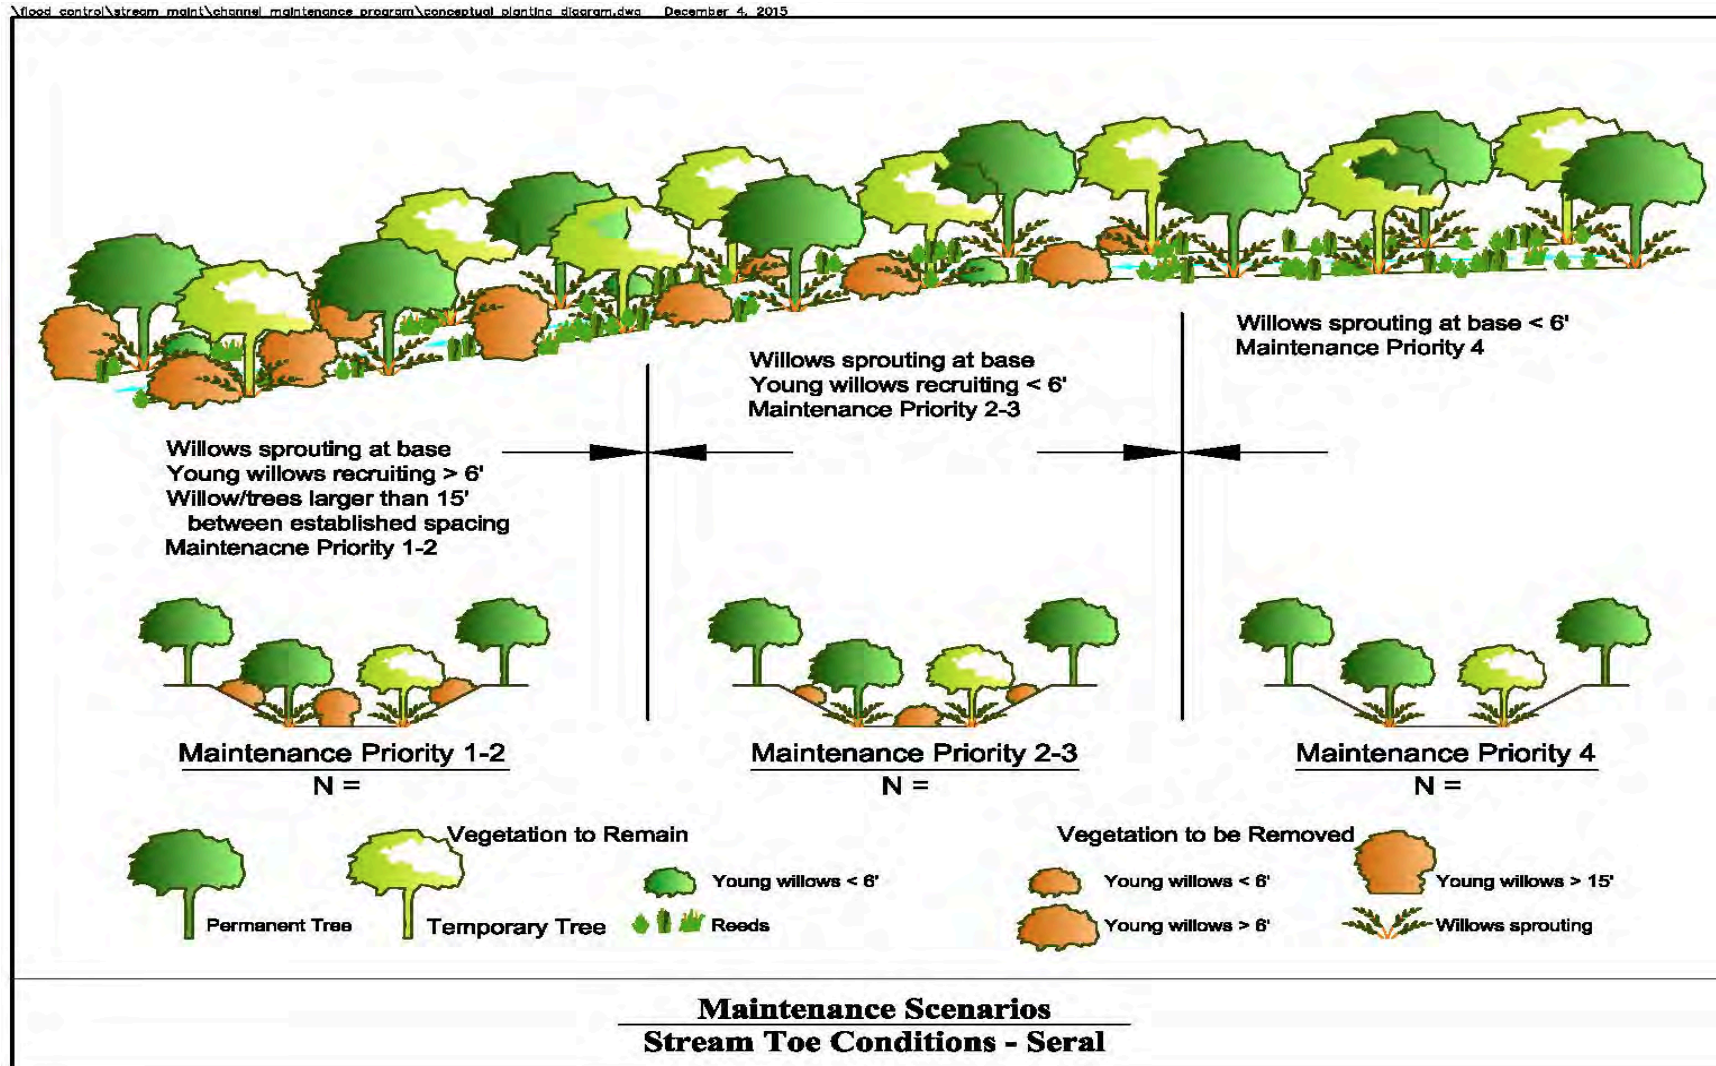

Inherent Principles of Vegetation Management

- Shade reduces in-stream vegetation density

Inherent Principles of Vegetation Management

- Channel restoration is a successional process

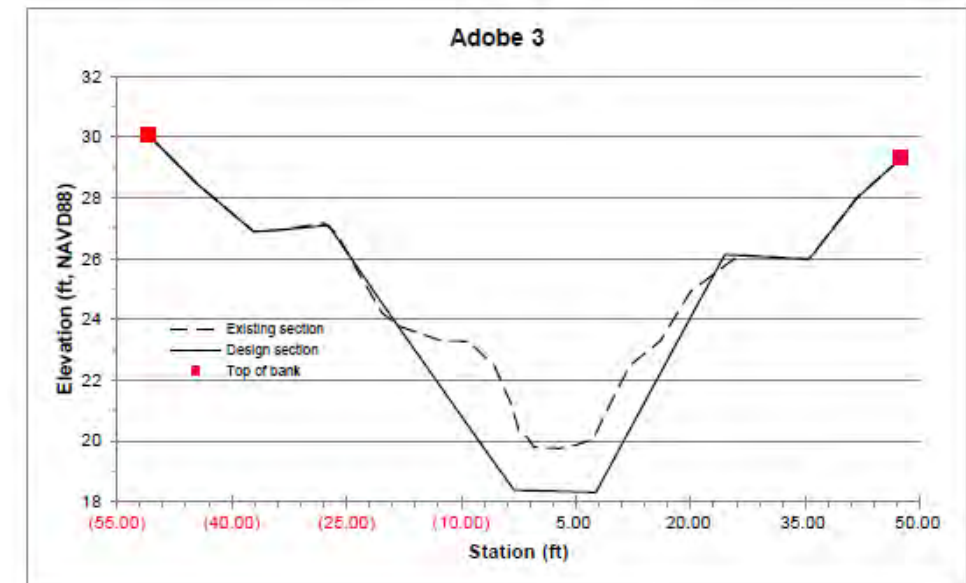

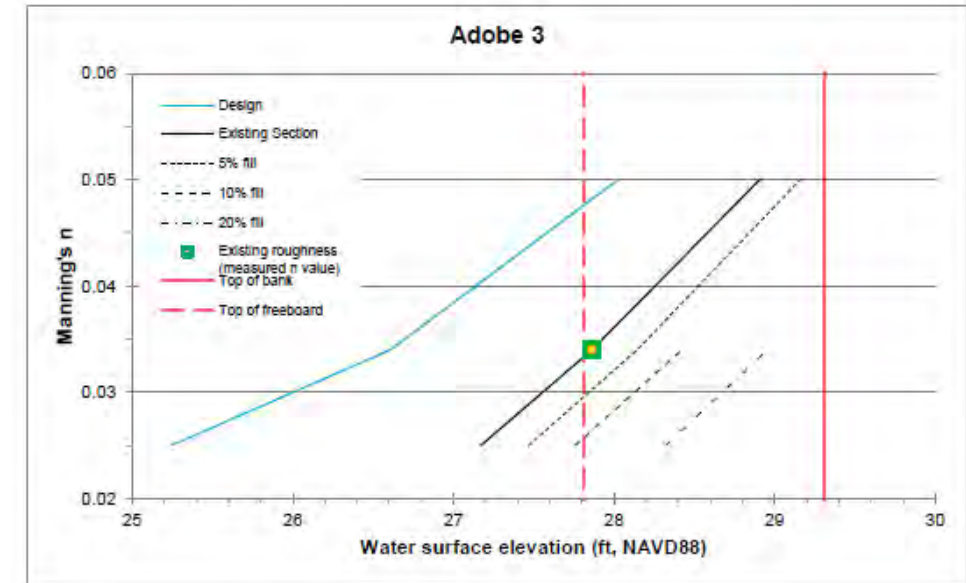

Inherent Principles of Vegetation Management

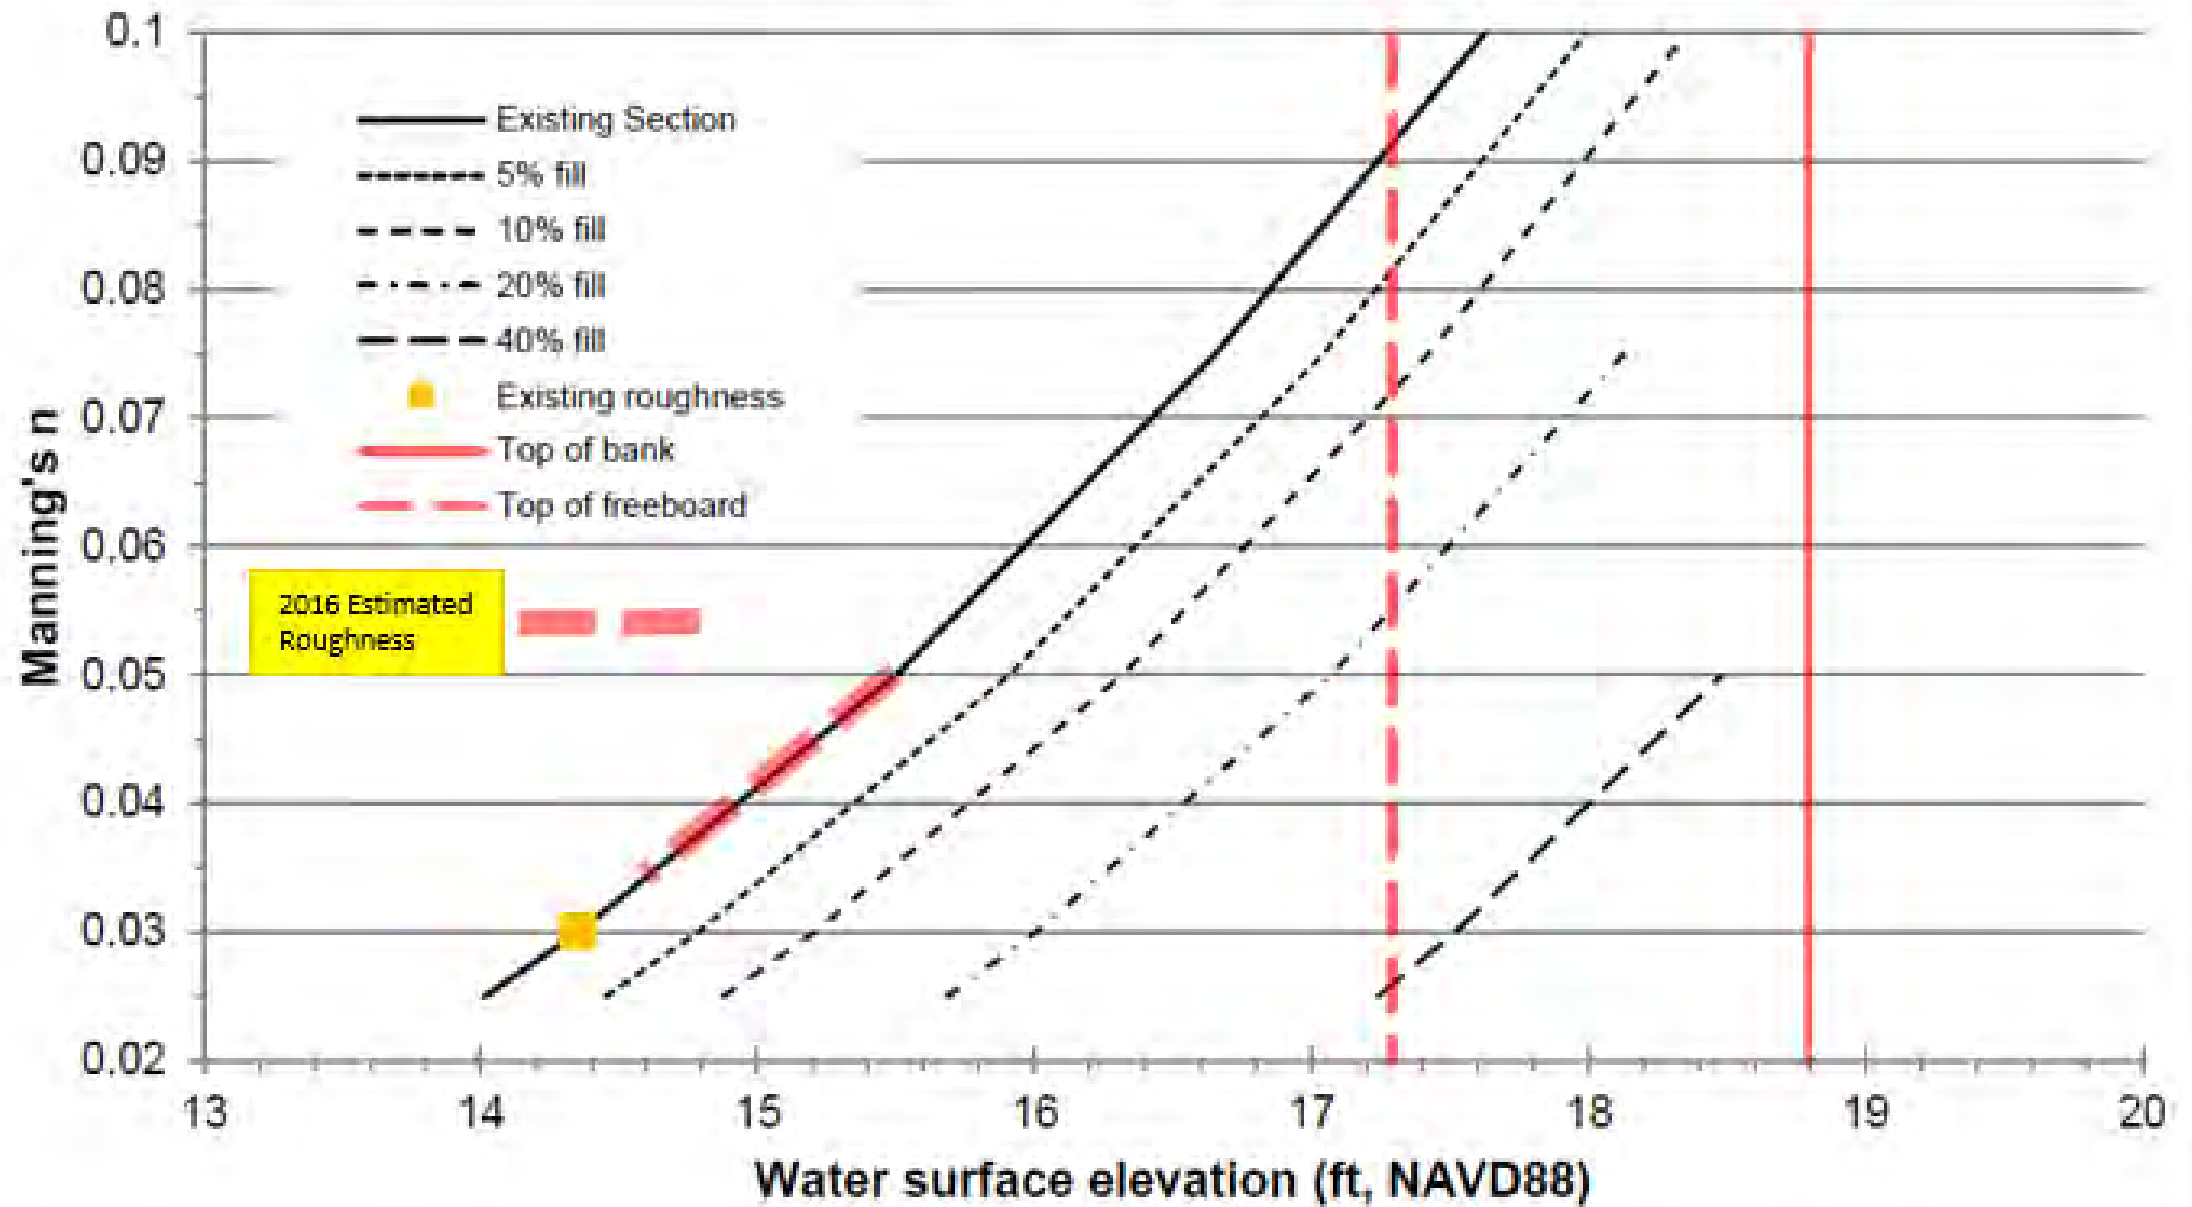

- Use species that provide structure in the summer but lay down in the winter

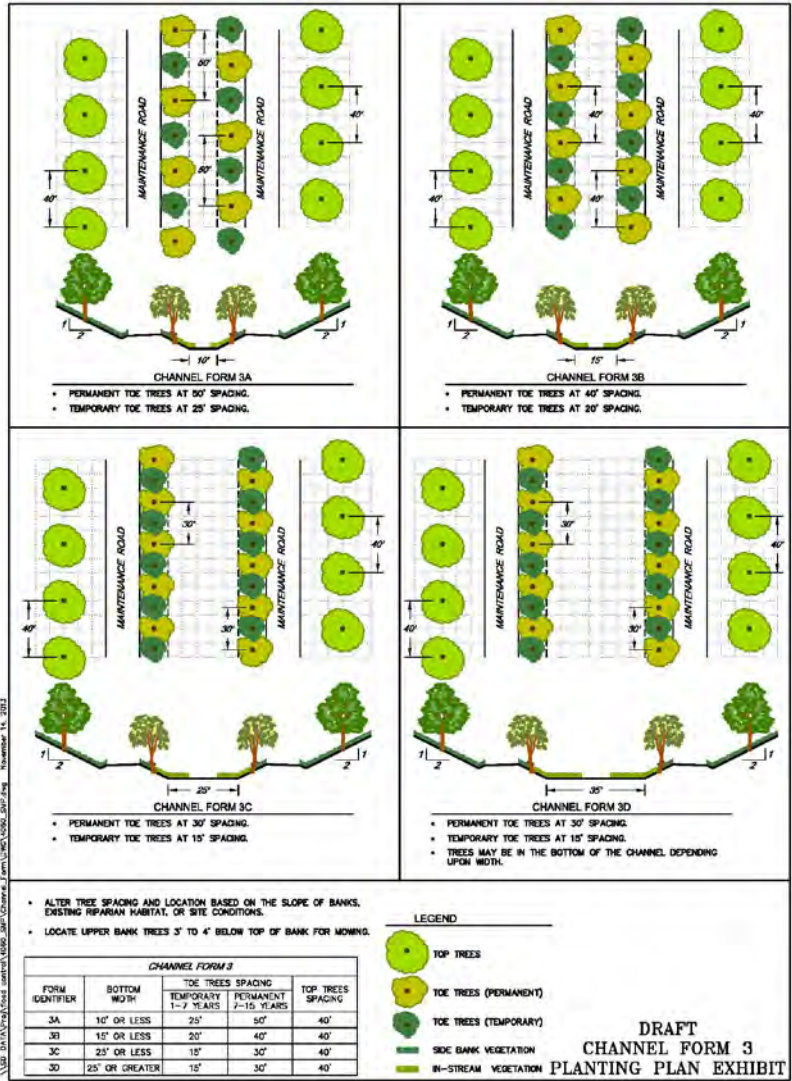

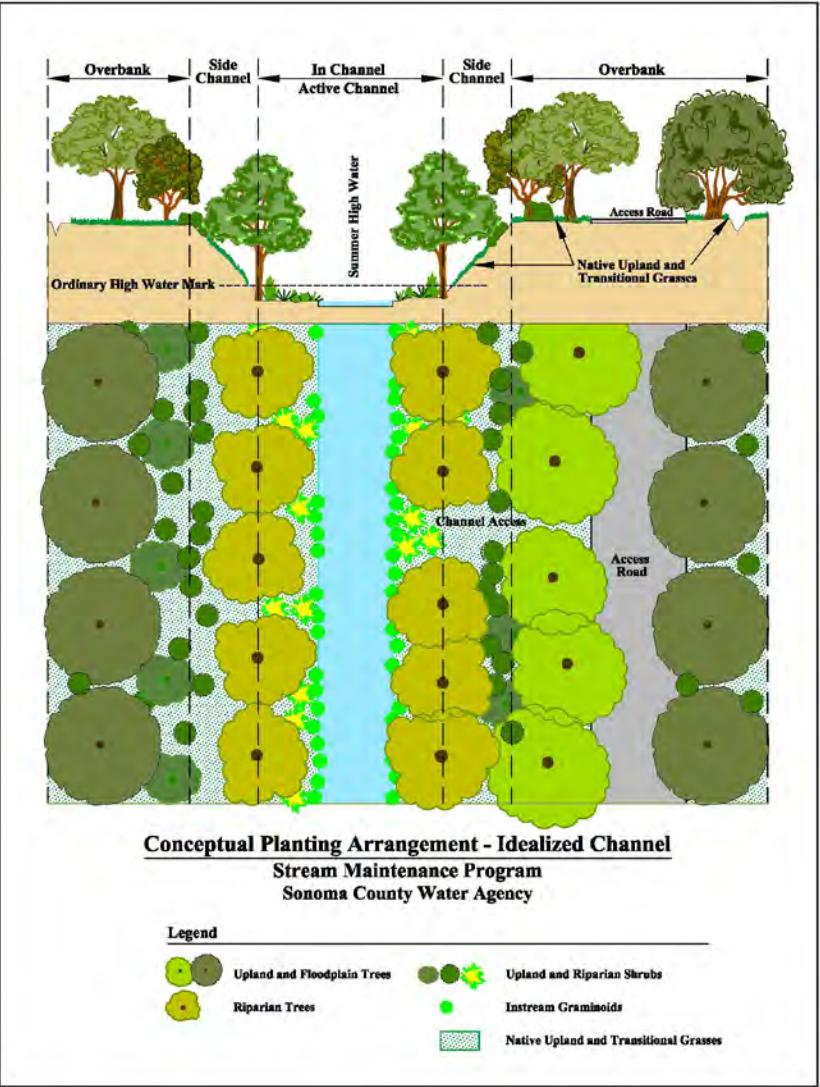

Developing Channel Maintenance Objectives

Adobe 1

Developing Successional Planting and Clearing Templates

Quantitative vs Qualitative Management

- Channel Assessments

- Roughness

- Estimates/Modeling

- Maintenance Objectives

- Climate Record

- Sediment Budget

- Planting Templates

- Species Selection

- Management Techniques

- Facility Condition

- Aesthetics

- Public Safety

- Preserving Sight-Lines

- Recreational Opportunities

- Assessing LWD/Blockages

- Retaining Trees

- Managing Complexity

- Professional Opinion

Work Need-Quantitative Triggers for Vegetation Management

- Deviation from Template “target trees”
 - Facility out of compliance with template
 - Trees recruiting between permanent trees
 - Sprouts at base of target trees
 - Successional trees thinned when canopy overlaps
- Roughness estimates
- Sprouts at base of tree
- LWD and debris blocking bankfull dimension
- Diameter at Breast Height (DBH) and other forest metrics-basal area, density, etc.

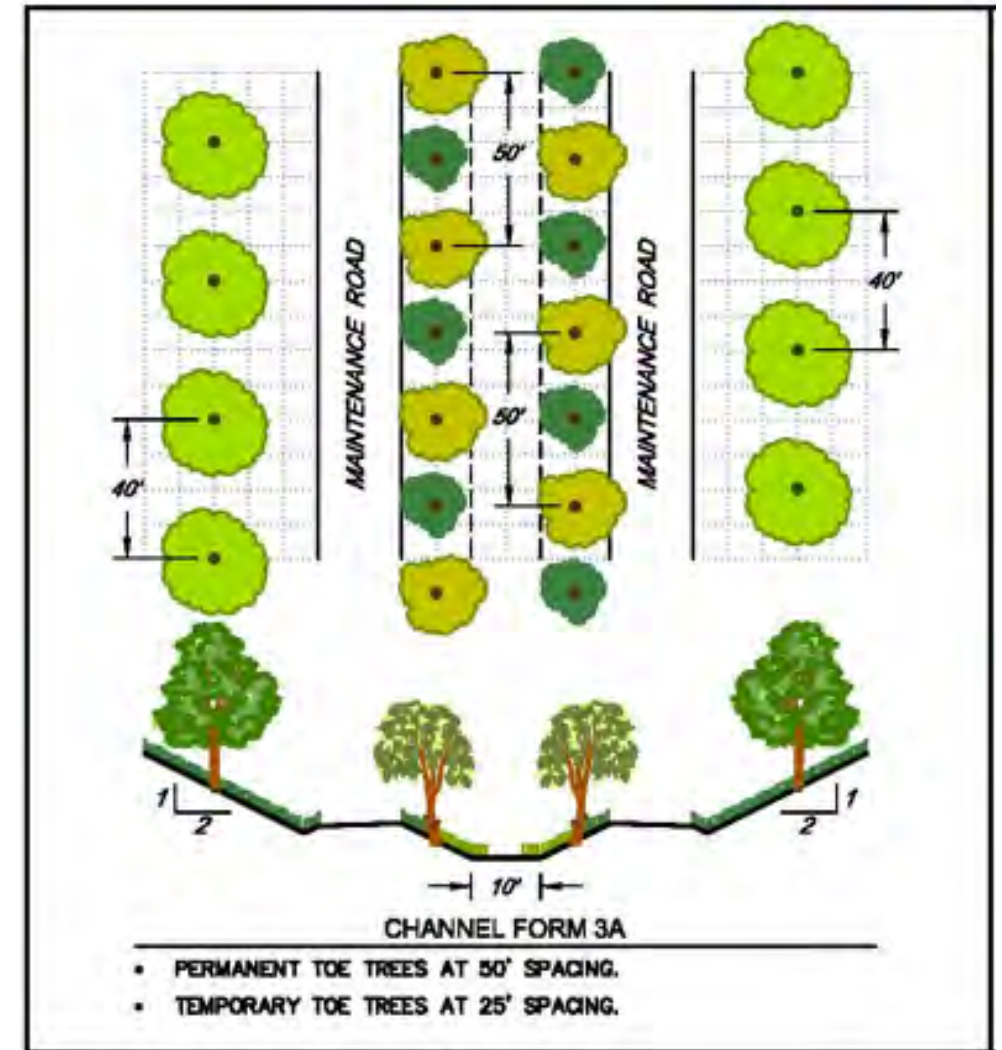

Work Need-Qualitative Triggers for Vegetation Management

- Vegetation is dead or dying
- Vegetation growth is significantly decreasing flood conveyance capacity, particularly where infrastructure or adjacent properties are at risk
- Fall hazards
- Vegetation is causing erosion in-channel
- Invasives are reducing native recruitment
- Decision to retain saplings
- Vegetation may cause a channel breakout
- Vegetation is creating significant scour
- Public Safety- sight-line clearance
- Fence line clearing

Planting and Clearing Templates

Establishing Canopy

- Target Trees vs Successional Trees
- Retaining saplings for future
- Thin by half between 5-7 years

Permanent Tree

Vegetation to Remain

Young willows < 6'

Reeds

Vegetation to be Removed

Young willows < 6'

Young willows > 6'

Young willows > 15'

Willows sprouting

Maintaining Canopy

- Retain target trees, plan for future recruitment
- Integrate with Objectives
- Manage Diameter at Breast Height < 3'

Vegetation to Remain

Permanent Tree

Young willows < 6'

Reeds

Vegetation to be Removed

Young willows < 6'

Young willows > 6'

Young willows > 15'

Willows sprouting

An aerial photograph of a residential neighborhood. A prominent yellow line runs vertically through the left side of the image. Several streets are labeled, including Jackson St, San Jose Creek, Wilson St, and others. In the top right corner, there is a red dot and the text "West End Neighborhood Assoc". At the bottom, there is a small inset map showing a different perspective of the same area. Metadata at the very bottom includes coordinates and elevation information.

An aerial photograph of a suburban neighborhood. A multi-lane road runs vertically on the left side. To its right is a large, open grassy area. Further right, there are several houses with dark roofs, surrounded by mature trees. A winding path or driveway leads through the trees. In the bottom right corner, there is a Google Maps logo and some text.

2012

Corona Creek: 2007 to 2016

Manage instream and upper bank Habitat with Aggressive Native Competitors

Plantings are designed to displace undesirable “sedimentation encouraging” species and/or respond favorably to periodic mowing and clearing.

Use native species to create a “Temporal Forest”

Plant herbaceous warm season perennial natives, these species lay down or break off in winter during high flows.

Re-purpose existing vegetation to the benefit of habitat

Manage density of trees in-channel, sidebank, and upper bank by pruning to renew brushy sub-canopy
